

Efficacy

The MB-1[®] vaccine provides, on average, 4-day earlier onset of immunity compared to other hatchery vaccines.

Convenience

The MB-1 vaccine adjusts its bursal replication to the individual titer of IBD Maternally Derived Antibodies (MDA), effectively clearing the 800 ELISA (IDEXX) titer and generating the desired immunity in every chick at the optimal time.

Safety

The MB-1 vaccine is safe and does not interfere with the immune response of other vaccines.
